## RFID NFC

RFID(Radio Frequency Identification) is a technology that uses electromagnetic waves to identify and track objects. It is widely used in various industries, including retail, logistics, and healthcare.

UHF (Ultra High Frequency) RFID tags are used for long-range identification and tracking. They are commonly used in supply chain management and inventory tracking.

NFC (Near Field Communication) is a short-range communication technology that allows devices to exchange data wirelessly. It is often used for contactless payments and data transfer.

NFC tags can be used for various applications, including access control, event management, and product authentication. They are easy to use and integrate with existing systems.
