## RFID Access Control System

RFID Access Control System is a secure and convenient way to manage access to a building or facility. It uses Radio Frequency Identification (RFID) technology to identify and authorize individuals. The system typically consists of an RFID reader, a central control unit, and RFID tags (keycards or fobs). The reader communicates with the tags to verify their identity and grant access to the designated area. This system offers enhanced security, as tags are difficult to replicate, and provides a user-friendly experience for authorized personnel. Additionally, it can be integrated with other security systems and provides detailed access logs for monitoring and auditing.
