RFID NFC

RFID(Radio Frequency Identification) is a technology that uses electromagnetic fields to automatically identify and track tags attached to objects. These tags can be read by a scanner, and the data is then processed by a computer system.

UHF tags are used for long-range applications, such as inventory tracking and supply chain management.

NFC (Near Field Communication) is a type of RFID that allows for short-range communication between devices.

NFC tags can be used for a variety of applications, including contactless payments, access control, and product authentication. NFC tags are small, thin, and can be embedded in a wide range of materials.
